Although the claims are not amended by this submission, this Listing of Claims is provided for ease of reference.

Listing of claims:

6

1. (Original) A method comprising:

executing a first instruction in a processor;

if the execution of the first instruction generates a cache miss, associating the first instruction with the cache miss:

enqueuing the first instruction for re-execution; and

after the cache miss with which the first instruction is associated is serviced, reexecuting the first instruction.

- 2. (Original) The method of claim 1, further comprising associating the cache miss with a second instruction dependent on the first instruction.
- 3. (Original) The method of claim 1, further comprising assigning an identifier to the cache miss.
- 4. (Original) The method of claim 1, further comprising determining a priority of the instruction.
 - 5. (Original) A processor comprising:

a re-scheduler to hold instructions enqueued for execution; and

association logic to form an association between a cache miss and an instruction generating the cache miss, the instruction to be enqueued in the re-scheduler.

6. (Original) The processor of claim 5, wherein the re-scheduler is further coupled to priority logic to determine a priority of instructions in the re-scheduler.

Application Ser. No. 10/743,142 Attorney Docket No. 2207/17413

- 7. (Original) The processor of claim 5, wherein the association logic is to assign an identifier to the cache miss.
- 8. (Original) The processor of claim 5, wherein the re-scheduler is to receive a signal indicating that the cache miss corresponding to the association has been serviced.
- 9. (Original) The processor of claim 8, wherein the re-scheduler is to cause an instruction to be designated as eligible for re-execution based on the signal.
 - 10. (Original) A method comprising:

4.,,

generating a cache miss in a processor;

assigning an identifier to the cache miss and writing the identifier in a field of a load instruction generating the cache miss;

issuing a request to service the cache miss to a memory system of the computer and providing the identifier to the memory system;

placing the load instruction in a queue for re-execution, where an eligibility of the instruction for re-execution is based at least in part on the identifier;

after the memory system completes servicing the request, causing the memory system to provide the identifier to the queue; and

designating the load instruction as eligible for re-execution based on the identifier provided by the memory system.

- 11. (Original) The method of claim 10, further comprising re-executing the load instruction based on receiving the identifier from the memory system.
- 12. (Original) The method of claim 10, further comprising propagating the identifier to any instruction dependent on the load instruction.
 - 13. (Original) A method comprising:

in a processor, enqueuing a plurality of instructions needing re-execution due to respective cache misses in a re-execution queue;

associating each instruction in the queue with a respective corresponding cache miss; and

after a cache miss is serviced, re-executing those instructions in the re-execution queue associated with the serviced cache miss.

- 14. (Original) The method of claim 13, further comprising determining a priority of the instructions.
- 15. (Original) The method of claim 13, wherein the associating comprises writing an identifier of a cache miss in an instruction.
 - 16. (Original) A system comprising:
 - a memory system to hold instructions for execution;
 - a processor coupled to the memory system, the processor including:

a re-scheduler to hold instructions from the memory system enqueued for execution; and

association logic to form an association between a cache miss and an instruction generating the cache miss, the instruction to be enqueued in the rescheduler.

- 17. (Original) The system of claim 16, wherein the re-scheduler is further coupled to priority logic to determine a priority of instructions in the re-scheduler.
- 18. (Original) The system of claim 16, wherein the association logic is to assign an identifier to the cache miss.
